

HB0028

96TH GENERAL ASSEMBLY

State of Illinois

2009 and 2010

HB0028

Introduced 1/14/2009, by Rep. Mary E. Flowers

SYNOPSIS AS INTRODUCED:

New Act

Creates the Menu Education and Labeling Act of 2009. Requires restaurants and similar retail food establishments to post a sign informing their customers that certain foods on their menus may be high in calories, grams of saturated fat plus trans fat, and milligrams of sodium per serving, which has been known to cause diabetes, heart disease, and high blood pressure.

LRB096 03338 RPM 13359 b

FISCAL NOTE ACT
MAY APPLY

A BILL FOR

1 AN ACT concerning public health.

2 **Be it enacted by the People of the State of Illinois,**
3 **represented in the General Assembly:**

4 Section 1. Short title. This Act may be cited as the Menu
5 Education and Labeling Act of 2009.

6 Section 5. Legislative findings.

7 (a) Research continues to reveal the strong link between
8 diet and health, and that diet related diseases start early in
9 life.

10 (b) Increased caloric intake is a key factor contributing
11 to the alarming increase in obesity in the United States.
12 According to the Centers for Disease Control and Prevention,
13 two-thirds of American adults are overweight or obese, and the
14 rates of obesity have doubled in children and tripled in teens
15 since 1980. Obesity increases the risk of diabetes, heart
16 disease, stroke, and other health problems. Each year obesity
17 costs families, businesses, and the government \$117 billion.

18 (c) Excess saturated fat intake is a major risk factor for
19 heart disease, which is the leading cause of death in the
20 United States. While it is often thought to primarily affect
21 men and older people, cardiovascular disease is the leading
22 killer of women and kills 61,000 people between the ages of 45
23 and 64 each year. Heart disease is also a leading cause of

1 disability among working adults and its impact on the U.S.
2 economy is significant, estimated in 2004 to cost \$368 billion
3 in health care expenditures and lost productivity.

4 (d) Increased sodium intake is associated with increased
5 risk of high blood pressure, or hypertension, a condition that
6 can lead to cardiovascular disease, especially stroke. The
7 proportion of Americans with high blood pressure is 45% at age
8 50, 60% at age 60, and over 70% at age 70.

9 (e) Over the past 2 decades there has been a significant
10 increase in the number of meals prepared and eaten outside the
11 home, with an estimated one-third of calories and almost half
12 (46%) of total food dollars being spent on food purchased from
13 and eaten at restaurants and other food-service
14 establishments.

15 (f) While nutrition labeling is currently required on most
16 processed foods, such information is required only for
17 restaurant foods for which nutrient content or health claims
18 are made.

19 (g) Three-quarters of American adults report using food
20 labels on packaged foods, which are required by the federal
21 Nutrition Labeling and Education Act of 1990. Using food labels
22 is associated with eating a more healthy diet, and
23 approximately half (48%) of people report that the nutrition
24 information on food labels has caused them to change their
25 minds about buying a food product.

26 (h) It is difficult for consumers to limit their intake of

1 calories at restaurants, given the limited availability of
2 nutrition information as well as the popular practice by many
3 restaurants of providing foods in larger-than-standard
4 servings and super-sized portions. Studies show that people eat
5 greater quantities of food when they are served more.

6 Section 10. Nutritional label information. Restaurants and
7 similar retail food establishments shall post a sign no smaller
8 than 8 inches by 5 inches stating that, "Certain foods on the
9 menu may be high in calories, grams of saturated fat plus trans
10 fat, and milligrams of sodium per serving, which has been known
11 to cause diabetes, heart disease, and high blood pressure."
